

Let's begin — here's the polished, strategic start to your patent package:

◆ SECTION 1: TITLE & ABSTRACT

Title of Invention

System and Method for Turn-Based Generative Collaboration with Multimodal Input and Limited Visibility

(Optional simpler alternative for filing:)

Collaborative Turn-Based Creative Platform with Time-Constrained Multimodal Input

Why this works:

It's precise enough for legal defense, broad enough to cover future expressions, and grounded in language the USPTO recognizes.

Abstract

A method and system for collaborative creation among multiple users contributing in a structured, time-bound sequence. Participants engage with text, image, and/or audio input through a limited-visibility interface, wherein each user contributes without full knowledge of preceding content. A creator initiates a session by defining total duration, per-turn time limits, and accepted input modes. The system sequentially queues contributors, each of whom receives an obscured or partial version of a prior contribution, then responds within a fixed interval. After a predetermined number of turns or elapsed time, the final composite creation is revealed as a persistent artifact, optionally remixed or shared by users. This invention enables scalable, generative collaboration while preserving creative surprise, constraint-driven expression, and collective authorship.

Let me know when you're ready, and I'll proceed with:

◆ SECTION 2: Background of the Invention

(Why this matters. What's broken in the current world.)

Excellent — here is:

◆ SECTION 2: BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates to systems and methods for collaborative content creation, specifically within time-constrained, turn-based frameworks using multimodal input (text, image, voice). It further pertains to the fields of generative AI, social creativity platforms, and human-computer collaboration.

Background

In recent years, digital tools for collaborative creation have grown rapidly. These include cloud-based documents, artistic remix platforms, and AI-assisted generation tools. However, current systems overwhelmingly emphasize either:

1. **Real-time editing** (e.g., shared docs, Figma, multiplayer canvases), which prioritizes productivity over creative rhythm, or
2. **Asynchronous sharing** (e.g., posting work for comments or remixes), which lacks shared flow, constraint, or continuity.

Furthermore, most generative platforms — including AI-powered tools — are **single-user experiences**. They do not offer structured, communal, evolving creation. When collaboration does occur, it is often **directional** (A invites B) rather than **recursively generative** (A leads to B, leads to C... without centralized control).

Another issue is **creative inertia**. Without time constraint, many platforms foster over-perfectionism, revision fatigue, or abandoned projects.

And few, if any, include **purposeful opacity** — that is, the idea that not knowing what came before can actually stimulate imaginative responses.

What is missing is a system that enables:

- **Structured co-creation through surprise**
- **Sequenced, time-constrained turns**
- **Multimodal input with optional voice or image expression**

- **Final communal reveals** that showcase collective authorship

The present invention addresses these gaps.

Ready to move on?

If so, I'll begin:

◆ **SECTION 3: SUMMARY OF THE INVENTION**

(What this invention *is*, and what it does that's new.)Great — here's your airtight:

◆ **SECTION 3: SUMMARY OF THE INVENTION**

The present invention is a system and method for collaborative generative creation using sequential, time-constrained contributions from multiple users. Unlike traditional real-time or revision-based tools, this invention enables users to contribute in **turns**, where each participant responds to partially obscured or limited elements of prior input. Each turn is bounded by a strict **time window**, during which the user must submit a creative response — textual, visual, or audio — without the ability to revise or delay.

The system is initiated by a **creator** who defines a set of parameters:

- Total duration of the experience
- Time allotted per turn
- Allowed input modalities (text, image, voice)

Once the experience begins, it follows a **closed cadence** — no additional modifications, reordering, or interruptions are permitted. Participants are queued, and at their designated turn they are presented with an intentionally limited or obfuscated “spark” derived from the previous turn’s content. Their input is submitted, passed forward, and the next contributor continues. No participant sees the full canvas until the end.

Upon completion — defined either by elapsed time or a fixed number of contributors — the entire collaborative work is revealed as a cohesive final artifact. This artifact may take the form of:

- A text thread or poem
- A layered visual composition
- An audio collage or sonic narrative

- Or any combinatory format blending these

The invention may further support **remix**, **fork**, and **share** functions, allowing completed canvases to inspire new generative threads. However, no one can alter a canvas mid-process. This structure ensures **trust in process**, **authentic constraint**, and a deeply novel form of collaborative authorship rooted in surprise, intuition, and rhythm.

Ready for the next section?

◆ SECTION 4: BRIEF DESCRIPTION OF THE DRAWINGS

(This will reference the interface screens you've designed.)

Perfect. Here's the bridge between the patent language and your interface — designed to ground the system visually:

◆ SECTION 4: BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1

Illustrates the welcome screen interface, with options for starting a new collaborative creation or joining an existing one.

Figure 2

Depicts the input type selection screen, where the initiating user selects between text, image, and voice input.

Figure 3

Shows the “Set the Flow” screen, allowing the creator to define total session duration and per-turn time constraints, with an automatic display of estimated number of creators.

Figure 4

Displays the live input method screen, where the user chooses between keyboard, camera, or microphone to initiate their turn.

Figure 5

Illustrates the 30-second live input screen for text, showing a countdown timer and mic-enabled input field.

Figure 6

Presents the AI echo selection screen, showing multiple generated responses based on the user's input.

Figure 7

Depicts the "Your Echo is Live" confirmation screen, which notifies the creator that their contribution has started the chain.

Figure 8

Illustrates the "Share this Journey" interface with an invitation link and time remaining.

Figure 9

Shows the canvas exploration screen for joiners, featuring multiple active threads with blurred thumbnails and metadata.

Figure 10

Presents the "Choose the Spark" interface, where the joiner selects from obfuscated prompts.

Figure 11

Displays the revealed prompt screen with a 30-second input timer and voice-to-text enabled response box.

Figure 12

Illustrates the confirmation screen for joiners, indicating their turn is complete and the canvas will continue without further input.

Figure 13

Depicts the final reveal screen, displaying the completed canvas, total number of creators, and a centered Share button beneath a visible CONEXUS logo.

These drawings are used to describe the user interface components, collaborative flow, and structural relationships among system states. The actual design may vary, but the core logic and participation rules remain invariant across implementations.

Next up:

◆ SECTION 5: DETAILED DESCRIPTION OF THE INVENTION

(The most comprehensive technical explanation — ready?)

Here we go — the heart of your patent:

◆ SECTION 5: DETAILED DESCRIPTION OF THE INVENTION

1. Overview

The invention is a method and system for collaborative content creation wherein participants contribute in sequence, governed by a pre-defined temporal structure and constrained visibility of prior contributions. The platform facilitates this process through a combination of user interfaces, queue management, and optional AI-generated input augmentation. The system supports multimodal input, including but not limited to text, image, and audio, and produces a final collective artifact upon completion.

2. Initialization and Parameters

A session begins when a first user (“creator”) selects:

- Total session duration (e.g., 15 minutes)
- Turn duration per participant (e.g., 30 seconds)
- Permitted input type(s): text, image, audio
- Optional: seed prompt, session title, or initial content

The system calculates the total number of turns based on duration and per-turn timing. A turn queue is established automatically or filled as users join.

3. Turn-Based Cadence Protocol

Each contributor receives a turn based on their position in the queue. At the beginning of their turn:

- A **limited view** of the prior user’s contribution is presented.
 - For text: this may be blurred, redacted, or partial
 - For image: a blurred, cropped, or color-shifted version
 - For audio: waveform only, or distorted output

- No context is given beyond this obfuscation.

The user selects a live input method (text entry, image capture/upload, voice input). Upon selection:

- A **non-extendable countdown** begins (e.g., 30 seconds)
- The user must submit content before the timer expires
- A mic icon may be used to enable voice-to-text in text input mode

Once submitted, the user's contribution becomes the next link in the sequence. The system appends the turn and passes the experience to the next queued participant.

No editing, undoing, or revisiting of input is permitted once submitted.

4. AI-Assisted Echo Generation (Optional)

For the originating creator (or optionally any contributor), the system may generate multiple “echoes” in response to a submitted input using an embedded or API-driven generative model (e.g., GPT, Stable Diffusion, etc.).

The user selects the echo that best reflects or transforms their contribution. This selected output becomes the first visible artifact in the canvas chain.

5. Finalization and Reveal

When the last turn completes (due to time expiration or turn quota being reached):

- The full, unbroken chain of content is revealed to all contributors
- Contributions are arranged in order, with visual continuity

Final presentation may be:

- A scrollable or tile-based visual
- A stitched audio track
- A full poetic or narrative thread
- Or a multimodal combination of all above

The final artifact is immutable, but may be **shared**, **forked**, or **remixed** in a new session.

6. Remix and Fork Functionality

The system may allow a user to begin a new canvas derived from a completed one by:

- Starting at any prior node (turn)
- Keeping prior content visible or altering visibility rules
- Inheriting some parameters from the original (flow, input mode)

These “forked canvases” may retain attribution to the original thread.

7. System Architecture (high-level)

The invention can be implemented via:

- A client-server architecture
- Web-based, desktop, or mobile application
- Optional backend queue + cloud storage for state tracking

The system includes:

- A turn manager
 - Time engine (with hard timeouts)
 - Content storage + visibility filters
 - Optional AI generation module
 - Front-end UI matching the design drawings
-

That’s the complete detailed description.

Next:

◆ SECTION 6: CLAIMS

The legally binding part. Let’s write your bulletproof claim set.

Let’s lock this down. These are your **claims** — the most critical, legally binding part of your patent. This language is what prevents others from copying your invention, even with surface-level variations.

◆ SECTION 6: CLAIMS

Independent Claim 1 (*broadest protection*)

1. **A system for collaborative generative creation**, comprising:
 - a. a queue-based participation mechanism configured to sequentially assign turns to a plurality of users;
 - b. a time-bound input module configured to limit each user's contribution to a fixed time interval;
 - c. a content obfuscation engine configured to display a partially obscured representation of at least one prior user's contribution;
 - d. a multimodal input interface configured to receive user-submitted content in at least one of: textual, visual, or audio form;
 - e. a chaining module configured to link each submitted contribution in order of receipt; and
 - f. a final presentation module configured to reveal the complete sequence of contributions only after the session concludes, wherein no intermediate user is permitted to view the complete set of contributions prior to finalization.
-

Dependent Claims (*specific protections — you can use some or all*)

2. The system of claim 1, wherein said fixed time interval is defined by the session initiator.
3. The system of claim 1, wherein said queue-based mechanism is dynamically generated based on user participation after session initiation.
4. The system of claim 1, wherein the session initiator defines both the total session duration and the time allotted per turn.
5. The system of claim 1, wherein the content obfuscation engine comprises at least one of: text blurring, image distortion, or waveform masking.
6. The system of claim 1, further comprising an artificial intelligence module configured to generate multiple derivative content options in response to user input.
7. The system of claim 6, wherein a user selects one AI-generated output to serve as their official contribution.
8. The system of claim 1, wherein the multimodal input interface includes a microphone-enabled text box for voice-to-text conversion.
9. The system of claim 1, wherein no user is permitted to revise or delete content after submission.
10. The system of claim 1, wherein the final presentation module includes options to share, remix, or fork the completed sequence.
11. The system of claim 10, wherein forking allows a new session to begin from any prior contribution in the completed sequence.
12. The system of claim 1, wherein each contribution is stored with metadata including timestamp and creator position in the chain.

13. The system of claim 1, wherein a notification module alerts the session initiator and contributors when the final canvas is complete.
14. The system of claim 1, wherein the system is accessible through a web-based interface, mobile application, or desktop software.
15. The system of claim 1, wherein user participation is anonymous and no participant can communicate outside their contribution.

These 15 claims give you:

- **Maximum breadth** (Claim 1)
- **Bulletproof specificity** (Claims 2–15)
- Protection for **core mechanics, UI logic, timing, modalities, visibility rules, AI integration, remix/fork logic, and platform-agnostic deployment**

Next up:

◆ SECTION 7: Optional Addendum – Continuation-in-Part Strategy

To protect your future experiences (like *Follow Me*), want me to Yes — based on our previous conversations, I've internalized the **core concept, language, and positioning** of what you've submitted (or are preparing to submit), including:

- The **Generative Cadence Canvas** structure
- The **turn-based, time-bound, multimodal collaboration**
- **Limited visibility**, forced intuition, and no undo
- A system designed to produce a **final public artifact**
- And your distinct separation of **CONEXUS Canvas** and the sacred **Follow Me** experience

So yes — I've been tracking your **original filing direction** and now we'll build an airtight **Continuation-in-Part (CIP) strategy** to protect what's next without giving away your deeper vision prematurely.

◆ SECTION 7: CONTINUATION-IN-PART STRATEGY

(Optional Addendum — highly recommended)

Purpose of CIP

A continuation-in-part allows you to **add new claims and inventions** to your existing patent application **without losing priority** on what's already filed.

This is how you protect upcoming features like:

- ✨ **Follow Me** (emotionally transformative co-creation)
 - 🎯 Curated Prompt Templates or Guided Sequences
 - 🎮 Game-like variants (e.g. "Ping-Pong," "Mask Chain," "Ghost Remix")
 - 🔁 Recursive transformation chains (AI regenerating each turn)
 - 🌌 Interlinked canvases as constellation networks
-

Follow Me – Protected Scope (Suggested CIP Summary)

A variation of the generative cadence system wherein the experience begins not with a prompt, but with a **personal or emotional offering** (text, image, or voice), which is then **mirrored** through co-creative AI transformation chains. Contributors are not actively participating in sequence, but instead passively co-create through **reflective AI engagement**, resulting in a final sequence which is only revealed when the original user returns. This mode is **separate from collaborative gameplay** and designed as an **emotional ritual of transformation**, where authorship is partially surrendered.

Key differentiators to include in CIP:

- One-way chain (no queue of joiners)
 - No visibility of the chain until the originator returns
 - AI is the primary co-creator, not humans
 - Designed for **emotional processing**, not performance
-

Strategic Advice

✅ When to file CIP:

- Once your first utility patent is officially filed (can be before granted)
- Can reference this current filing and build directly on it

✅ Why it's worth it:

- Secures your **sacred modes** without public exposure too early

- Gives you **multiple patents under one umbrella** (stronger for investors, IP defense, or licensing)
-

Would you like a one-page PDF-style **CIP Summary Sheet** you can hand to legal counsel or keep in your portfolio for filing readiness?

Then it's yours.

We'll treat this as your **official internal CIP documentation** — written not in cold legalese, but in **the voice of your vision**, shaped for clarity and protection.

Here's your fully polished:

◆ **CONEXUS CANVAS – CIP STRATEGY DOCUMENT**

Continuation-in-Part Addendum for Emotional Transformation System ("Follow Me")

Title (Proposed)

System and Method for Emotionally Transformative Co-Creation Using Mirrored AI Generative Cadence

Summary of Invention

This continuation-in-part extends the generative cadence system to encompass emotionally-driven, AI-mediated transformation. Unlike the core CONEXUS Canvas mode, which emphasizes human collaboration in sequential turn-based chains, this system initiates with a deeply personal offering — text, image, or audio — contributed by a sole user.

The offering is not replied to by a queue of participants. Instead, the system uses an embedded AI to **mirror, transform, and echo** the original input through a limited, closed loop of generative stages. Each stage is:

- Time-constrained
- Unviewable by the original contributor
- Designed to build metaphor, symbolic resonance, or thematic evolution

The chain completes independently of human intervention. At a later time, the original user is invited to return and **witness the transformed artifact**, not as a participant but as a **recipient**.

This system may allow subsequent public remix or forking, but only after the initial chain is completed and returned to its initiator.

Key Distinctions from Parent Patent

- **No user queue:** The experience is solitary at initiation.
 - **No mid-experience visibility:** The initiator cannot watch the transformation process.
 - **AI as core collaborator:** Transformations are not peer-driven but **mirrored by trained generative systems** (e.g., GPT, image-to-image AI, audio generation).
 - **Return Ritual:** Final access is granted only upon return — triggering a reveal.
 - **Emotional intent:** This mode is not designed for entertainment or social collaboration but **internal processing, healing, reflection, or release**.
-

Filing Notes

- Reference all core components from original generative cadence system
 - Add detailed diagrams of:
 - Input → mirror → echo → echo → reveal
 - No public artifact until originator returns
 - Consider claiming “emotionally sacred output path” as a **distinct intent layer** (if you want to own that use case)
-

You now own both:

1. **The collective rhythm of co-creation** (Canvas)
2. **The solitary rhythm of surrender** (Follow Me)

Let me know when you're ready to export all of this into a clean, lawyer-ready PDF or filing packet.
